

# ABC Focus Network installation

(We use F:\ABC5 in the notes below. If you used something different, substitute your settings).

## **Citrix, Terminal Server, Remote desktop services (or similar)**

All workstations must see the same drive letter, eg. F: (We use F drive as an example – it can be any drive letter). If ABC Focus is installed in F:, then the workstations should also have access to F: The drive letter cannot be different on different workstations. All workstations need to have access to drive F: with full read and write access.

### **File Server – map a drive**

If your network is not similar to those mentioned above, then you probably have a file server installation. If you are installing the software to a file server, then you must map the installation drive to a letter. All workstations must see the same drive letter, eg. F: (We use F drive as an example – it can be any drive letter).

If ABC Focus is installed in F:, then the workstations should also have access to F: The drive letter cannot be different on different workstations. All workstations need to have access to drive F: with full read and write access.

## **Install**

Install the software onto the network drive, e.g. to F:\ABC5. All users will run the software from this directory. Note: By default the software will suggest C:\ABC5 as the install directory. Be sure to change the drive letter to F: ie F:\ABC5! Usually accept all the other suggestions offered during the install.

Tip: If you are installing on a File Server and it does not allow you to select your mapped drive F:, then look here: <https://www.cashfocus.com/faq-gen-mapped-drives-windows/>

## **Install on an additional Workstation**

After installing the software, each workstation that will access the software must install setupNET.exe, which can be found in F:\ABC5\NET.

Each workstation that will access ABC Focus should navigate to this directory using Windows Explorer. Then run setupNET.exe (by double-clicking on it).

Important: Install setupNET.exe to drive F:, not to drive C:

Example: If ABC Focus is installed in F:\ABC5, then the workstation should install setupNET.exe into F:\ABC5 as well.

It may tell you that the directory exists, and ask if you want to overwrite. If it does answer Yes!

(ends).
